1. Introduction

Project Overview

Event planning companies handle many things at the same time: client requests, venue bookings, vendor assignments and feedback. When these live in notebooks, chats and spreadsheets, bookings clash, vendors are missed and clients are not kept informed. EventForce Management System moves all of this into one Salesforce CRM so that every event, client, venue and vendor is tracked in a single connected data model.

The application is built in a Salesforce Developer Edition org. It uses custom objects for the data, a validation rule for clean entry, a Record-Triggered Flow for client reminders, an Approval Process for cancellations, Apex for venue availability and double-booking prevention, and a report and dashboard for visibility. Access is controlled by profiles, roles, a permission set and organization-wide defaults.

Purpose

- Store clients, events, venues, vendors and feedback in one connected CRM.
- Prevent a venue from being booked twice on the same date.
- Keep venue availability up to date automatically when an event is confirmed or cancelled.
- Remind clients three days before their event without manual follow-up.
- Route event cancellation requests through a manager approval with email alerts.
- Give each type of user only the access that their job needs.
- Show upcoming events and venue usage through a report and a dashboard.

2. Ideation Phase

Problem Statements

The table below records the problems that motivated the project, written from the point of view of each person affected.

#	I am	I am trying to	But	Because	Which makes me feel
PS-1	An event coordinator	Schedule events without clashes	A venue can get booked twice on the same date	Bookings are tracked in notebooks, chats and spreadsheets	Stressed
PS-2	A client	Stay informed about my event	I am not reminded before the event	Follow-up is done by hand	Anxious
PS-3	A vendor manager	Assign vendors for catering, decor and logistics	Vendors are missed	Vendors are not linked to events in one place	Frustrated
PS-4	An event admin	Control who can see and change data	Access is not matched to each job	There is no role-based setup	Concerned

#	I am	I am trying to	But	Because	Which makes me feel
PS-5	An event coordinator	Cancel an event properly	Cancellations are not reviewed	There is no manager approval step	Uncertain

Summary of needs. Clashing bookings, missed vendors, manual client follow-up and uncontrolled access all point to one need: a single connected system that checks bookings, updates venue status, reminds clients, routes cancellations for approval and limits access by role.

Empathy Map

Persona: Event Coordinator. The map captures what the coordinator experiences while planning events.

THINKS & FEELS Wants every booking to be correct and every client to feel looked after.	HEARS Client requests, change requests and vendor calls arriving all day.
SEES Event dates, venues, event status, client details and upcoming events.	SAYS & DOES Schedules events, talks to clients and raises cancellation requests.
PAINS Double bookings, manual reminders, missed vendors and unclear cancellation approval.	GAINS Clash-free bookings, automatic venue status, automatic reminders and a clear view of upcoming events.

Brainstorming and Idea Prioritization

Four approaches were considered: manual notebooks, spreadsheet-based tracking, a standalone booking tool, and a Salesforce CRM. Ideas were then placed on an impact-versus-feasibility grid.

	LOW FEASIBILITY	HIGH FEASIBILITY
HIGH IMPACT	High impact, low feasibility - Client portal for self-service - SMS / WhatsApp reminders	High impact, high feasibility - Block double booking of venues - Auto-update venue availability 3-day client reminder - Manager approval for cancellations - Report and dashboard
LOW IMPACT	Low impact, low feasibility Mobile app for coordinators	Low impact, high feasibility - Custom tabs for each object - Event Planner Lightning App - Email format validation

Top prioritized ideas: double-booking prevention, automatic venue status, client reminder Flow, cancellation approval, and a report and dashboard on upcoming events.

Final Selection

A Salesforce CRM was chosen because it offers:

- Declarative automation through Flow and Approval Process
- Apex for rules that need code
- Built-in security with profiles, roles, permission sets and sharing settings
- Reports and dashboards without extra tools
- Less manual follow-up for the whole team

3. Requirement Analysis

Customer Journey Map

An event moves through eight stages, from the moment a client asks for a service to the feedback collected afterwards.

Stage	Client action	System action	Outcome
1. Request	Asks for an event service	Coordinator creates the Client and Event records	Event recorded
2. Validation	Gives contact details	Email format is checked on save	Clean client data
3. Venue check	No direct action	Double-booking check runs for the venue and date	No clash
4. Confirmation	Receives confirmation	Event Status set to Confirmed; venue becomes Reserved	Venue reserved
5. Vendors	No direct action	Vendors are linked through the Event Vendor object	Vendors assigned
6. Reminder	Gets a reminder email	Flow sends the email 3 days before the Event Date	Client informed
7. Event done	Attends the event	Batch job marks past events as Completed	Event closed
8. Feedback	Shares feedback and rating	Feedback record is linked to the Event and Client	Insights gathered

If an event must be cancelled, the status is set to Pending Cancellation, the record is locked and a manager approves or rejects the request. An approved cancellation frees the venue again.

Solution Requirements

Functional requirements

FR No	Requirement
FR-1	Create and manage Event, Client, Vendor, Venue and Feedback records
FR-2	Link each Event to a Client and a Venue; link Events and Vendors many-to-many
FR-3	Validate the Client email format before saving
FR-4	Block a second event at the same venue on the same date
FR-5	Update venue availability automatically (Reserved / Available)
FR-6	Route event cancellations through a manager approval with email alerts
FR-7	Send the client a reminder email 3 days before the event
FR-8	Mark past events as Completed through a scheduled batch job
FR-9	Control access by profile, role, permission set and sharing settings
FR-10	Show upcoming events through a report and dashboard

Non-functional requirements

Attribute	Description
Usability	Event Planner app puts all tabs, reports and dashboards in one navigation bar
Reliability	Rules run on save, so double bookings and invalid emails are stopped before data is stored
Performance	Batch job processes past events in batches of 200 records
Security	Each user gets only the access their profile, role and organization-wide defaults allow
Maintainability	Flow, approval process and validation rule can be changed from Setup without redevelopment
Scalability	Salesforce automation and batch Apex handle growing numbers of events

Data Flow

From the client request to the final report, data moves through the following stages:

Cancellation path: Event Status = Pending Cancellation → Record locked → Manager Review → Approved or Rejected → Email alert to the requester.

Technology Stack

Layer	Technology
Platform	Salesforce Developer Edition org
Data	Custom objects Event, Client, Vendor, Venue, Feedback and Event Vendor (junction); Lookup and Master-Detail relationships; formula field
Logic	Apex class, Apex triggers, Batch Apex and Schedulable Apex (API version 67)
Automation	Record-Triggered Flow (scheduled path), Approval Process, Email Alerts, Field Updates, validation rule
UI	Custom tabs, Event Planner Lightning App, Reports and Dashboards
Security	Profiles, Roles, Users, Permission Set, Organization-Wide Defaults

4. Project Design

Problem-Solution Fit

Problem	Solution	Benefit
Venue booked twice on the same date	PreventDoubleBooking trigger blocks the save	No clashing bookings
Venue status updated by hand	EventTrigger13 and VenueStatusHelper set Reserved / Available	Always current availability
Invalid client emails	Email_Valid_Address validation rule	Cleaner contact data
Clients not reminded	Record-Triggered Flow with a scheduled path	Reminder 3 days before the event
Cancellations not reviewed	Event_Cancellation_Process approval with record lock	Managers control cancellations
Past events left open	BatchCompleteEvents run by ScheduleCompleteEvents	Events closed automatically
Everyone sees everything	Profiles, roles, permission set and OWD	Role-based access
No overview of events	Report and EventForce Operations Dashboard	Quick view of upcoming events

Proposed Solution

Parameter	Description
Problem	Event details live in notebooks, chats and spreadsheets, so bookings clash, vendors are missed and clients are not kept informed.
Solution	A Salesforce CRM that stores clients, events, venues, vendors and feedback in one connected data model.
Innovation	Apex rules stop double bookings and update venue status automatically, while a scheduled Flow and an approval process remove manual follow-up.
Impact	Fewer booking errors, less manual follow-up, cleaner data and a clear view of upcoming events.
Business model	Event planning companies working with clients, venues, vendors, coordinators and admins.
Scalability	Scales through Salesforce automation, with room for time-slot checks, more approval steps, sharing rules and a client portal.

Solution Architecture

The solution is organized in layers. Users work in the Event Planner app, automation and Apex apply the business rules, and Salesforce records hold the data.

Users	Client Event Coordinator Vendor Manager Event Admin
Presentation layer	Event Planner Lightning App Custom tabs New Events with Venue Report EventForce Operations Dashboard
Automation layer	Client Reminder 3 Days Before (Flow) Event_Cancellation_Process (Approval) Email Alerts Field Updates
Apex layer	EventTrigger13 VenueStatusHelper PreventDoubleBooking BatchCompleteEvents ScheduleCompleteEvents
Data layer	Event__c Client__c Vendor__c Venue__c Feedback__c Event Vendor (junction)
Security layer	Profiles Roles Permission Set Organization-Wide Defaults

5. Project Planning and Scheduling

Planning Approach

- Agile methodology with sprint-based execution
- Work is split into user stories and sized in story points
- Velocity is calculated from completed story points and used for estimation

Product Backlog and Sprint Schedule

Sprint	Epic	USN	User story / task	Pts	Priority	Owner
1	Developer setup	USN-1	As an admin, I want to create and configure the Salesforce Developer org so the project can be built.	2	High	Grace Evangelin J
2	Data modeling	USN-2	As an admin, I want to create the objects, fields and relationships so event data is stored in a connected model.	5	High	Beulah J
2	Data quality	USN-3	As a coordinator, I want the Client email validated so contact data stays clean.	2	High	Jayasri K
3	Automation	USN-4	As a manager, I want an approval process for event cancellations so cancellations are reviewed.	5	High	Grace Evangelin J
3	Automation	USN-5	As a client, I want a reminder 3 days before my event so I am kept informed.	3	High	Jayasri K
4	Apex development	USN-6	As a coordinator, I want venue status updated and double booking blocked so bookings never clash.	8	High	Grace Evangelin J
4	Apex development	USN-7	As a coordinator, I want past events marked Completed by a batch job so records stay current.	5	High	Beulah J
5	UI and reporting	USN-8	As a user, I want tabs, the Event Planner app, a report and a dashboard so daily work is in one place.	5	Medium	Jayasri K
6	Security	USN-9	As an admin, I want profiles, roles, users, a permission set and sharing settings so access is controlled.	5	High	Beulah J

Story-point total: 40 across six sprints (2 + 7 + 8 + 13 + 5 + 5).

Sprint Tracker and Velocity

Sprint	Story points	Start date	End date	Points completed	Release date
Sprint-1	2	02 Oct 2026	02 Oct 2026	2	02 Oct 2026
Sprint-2	7	02 Oct 2026	02 Oct 2026	7	02 Oct 2026
Sprint-3	8	02 Oct 2026	02 Oct 2026	8	02 Oct 2026
Sprint-4	13	02 Oct 2026	02 Oct 2026	13	02 Oct 2026
Sprint-5	5	02 Oct 2026	02 Oct 2026	5	02 Oct 2026
Sprint-6	5	02 Oct 2026	02 Oct 2026	5	02 Oct 2026

Average velocity = total story points / number of sprints = $40 / 6$ = about 6.7 points per sprint. Sprint 4 carried the most work (13 points) because the Apex code was the largest part of the project.

Sprint Burndown (story points remaining)

Sprint burndown: ideal (dashed) versus actual (solid).

6. Project Development

The topics covered while building the solution were org setup, data modeling, validation, automation with Flow and Approval Process, Apex, the Lightning App, reports and dashboards, and the Salesforce security model.

Milestone 1: Salesforce Developer Org

A Salesforce Developer Edition org was signed up for, verified from the email link and opened in Setup. All objects, automation and code in this project were built inside this org.

Figure 1. Developer Edition org home page after login.

Milestone 2: Custom Objects

Five main objects were created from Setup > Object Manager: **Event**, **Client**, **Vendor**, **Venue** and **Feedback**. A sixth object, **Event Vendor**, is a junction object. Reports, search and Notes and Attachments were enabled on the objects. Feedback uses an Auto Number record name.

Figure 2. Object Manager showing the custom objects Feedback, Venue, Vendor, Client and Event.

Milestone 3: Fields and Relationships

Each object holds the fields it needs. The tables and screenshots below show the final field set.

Object	Key fields
Event	Event Name (Text 80), Client (Lookup), Venue (Lookup), Event Date (Date), Event Type (Picklist), Event Status (Picklist), Event Budget (Formula, Currency)
Client	Client Name, Phone, Email, Address (Text Area 255), City (Picklist), Country (Picklist)
Vendor	Vendor Name, Phone, Email, Service Type (Multi-select Picklist), Status (Picklist)
Venue	Venue Name, Address (Text Area 255), Location (URL), Capacity (Number), Availability Status (Picklist)
Feedback	Feedback (Auto Number), Client (Lookup), Event (Lookup), Rating (Picklist), Comments (Long Text Area)
Event Vendor	Event (Master-Detail), Vendor (Master-Detail)

Relationship	Type	Purpose
Event to Client	Lookup	Each event belongs to a client
Event to Venue	Lookup	Each event is held at a venue
Feedback to Event	Lookup	Feedback is given for an event
Feedback to Client	Lookup	Feedback comes from a client
Event Vendor to Event	Master-Detail	Junction side one
Event Vendor to Vendor	Master-Detail	Junction side two; gives the many-to-many link

Figure 8. Event Vendor junction object with two Master-Detail relationships.

Milestone 4: Validation Rule

To keep contact data clean, the Client object has an active validation rule named **Email_Valid_Address**. It checks the Email field against a pattern and blocks the save when the format is wrong. The error message *Please Enter Valid Email Address* is shown on the Email field.

Figure 9. Client validation rule Email_Valid_Address.

Milestone 5: Approval Process for Event Cancellation

The process **Event_Cancellation_Process** runs on the Event object. A record enters the approval when **Event Status equals Pending Cancellation**. The event owner is the initial submitter and a single step, **Manager Review**, sends the request to the assigned approver.

Stage	Actions configured
Initial submission	Record Lock; Email Alert "Alert - Event Cancellation Request"
Final approval	Record Lock; Email Alert "Cancellation Approved"; Field Update "Event Status Update"
Final rejection	Record Unlock; Field Update "Event Status To Rejected"; Email Alert "Cancellation Rejected"
Recall	Record Unlock

Figure 10. Approval Process detail: entry criteria, submitters and initial actions.

Figure 11. Approval step, final approval, final rejection and recall actions.

Milestone 6: Record-Triggered Flow

The Flow **Client Reminder 3 Days Before** is a Record-Triggered Flow on the Event object. It has a **Run Immediately** path and a **Schedule_3_Days_Before** scheduled path. The scheduled path waits until three days before the event date and then runs the action **Alert_Client_3Day_Reminder**, which sends the reminder email to the client. The Flow is saved and Active, with 0 errors and 0 warnings.

Figure 12. Flow Builder: Client Reminder 3 Days Before (Active).

Milestone 7: Apex Classes and Triggers

Apex handles the business rules that need code. All code is written in API version 67.

Component	Type	What it does
EventTrigger13	Trigger on Event (after insert, after update)	Calls VenueStatusHelper whenever an event is saved.

Component	Type	What it does
VenueStatusHelper	Apex class (with sharing)	Sets the venue to Reserved when the event is Confirmed and back to Available when it is Canceled.
PreventDoubleBooking	Trigger on Event	Looks up existing events at the same venue and adds the error "This Venue is already booked on this date." when the dates match.
BatchCompleteEvents	Batch Apex (Database.Batchable)	Finds events dated before today that are not Completed and marks them Completed.
ScheduleCompleteEvents	Schedulable Apex	Runs BatchCompleteEvents with a batch size of 200 on a schedule.

Figure 13. VenueStatusHelper class.

Figure 14. EventTrigger13 on the Event object.

Figure 15. PreventDoubleBooking trigger (double-booking check).

Figure 16. BatchCompleteEvents (Batch Apex).

Figure 17. ScheduleCompleteEvents (Schedulable Apex).

Figure 18. Apex Classes list in Setup showing the custom classes as Active.

Milestone 8: Custom Tabs

A custom tab was created for each object so that users can reach records quickly: **Clients, Events, Feedbacks, Vendors and Venues.**

Figure 19. Custom Object Tabs in Setup.

Milestone 9: Lightning App

The Lightning App **Event Planner** groups the project in one place. Its navigation bar contains Events, Venues, Clients, Vendors, Feedbacks, Event Vendors, Reports and Dashboards, so a user does not need to search Setup to do daily work.

Figure 20. Lightning Experience App Manager.

Milestone 10: Reports

A report folder named **EventForce Report** was created to hold the project reports. The report **New Events with Venue Report** uses the Events with Venue report type, groups rows by Event Date and shows Event Name, Venue Name, Event Budget, Event Type and Client.

Figure 21. Reports folder with the EventForce Report folder.

Figure 22. New Events with Venue Report.

Milestone 11: Dashboard

The dashboard **EventForce Operations Dashboard** shows the donut chart *Upcoming Events by Month*, built from the report data. It gives coordinators a quick view of how many events are coming up.

Figure 23. EventForce Operations Dashboard.

Milestone 12: Profiles

Custom profiles control what each user type can see and do. The profiles used are **Client Profile** (Salesforce Platform license), **Event Admin**, **Event Coordinator** and **Vendor Manager**.

Figure 24. Client Profile (custom profile, Salesforce Platform license).

Milestone 13: Roles

The role hierarchy places **Event Admin** under the CEO. The roles **Client**, **Event Coordinator** and **Vendor Manager** sit below Event Admin, so records owned by them are visible upward in the hierarchy.

Figure 25. Role hierarchy.

Milestone 14: Users

User	Role	Profile
Sizzler Jaligam	Event Admin	Event Admin
Nawin Prasath	Event Coordinator	Event Coordinator
Lakshmi sri	Vendor Manager	Vendor Manager

Figure 26. All Users list.

Figure 27. User detail: Sizzler Jaligam (Event Admin role and profile).

Milestone 15: Permission Set

The permission set **Feedback Manager** adds extra access on top of a profile without changing the profile itself. It is assigned to the user **Nawin Prasath** (Event Coordinator).

Figure 28. Permission Sets list showing Feedback Manager.

Figure 29. Feedback Manager permission set overview.

Figure 30. Current assignment of the Feedback Manager permission set.

Milestone 16: Sharing Settings (OWD)

Organization-Wide Defaults set the baseline record access. **Event is Private**, so users see only their own events and those of users below them in the role hierarchy. **Client, Feedback, Vendor and Venue are Public Read/Write** because these are shared reference records. “Grant Access Using Hierarchies” is enabled for the custom objects.

Object	Default access
Event	Private
Client	Public Read/Write
Feedback	Public Read/Write
Vendor	Public Read/Write
Venue	Public Read/Write

Figure 31. Organization-Wide Defaults for the custom objects.

7. Functional and Performance Testing

The table lists the checks planned for the main features. The Result column is filled in after each test is run in the org, with a screenshot attached as evidence.

ID	Feature	Test steps	Expected result	Result
TC-01	Email validation	Create a Client with an invalid email such as "abc@".	Save is blocked; message "Please Enter Valid Email Address".	Pending
TC-02	Double booking	Create two Events at the same Venue on the same date.	Second save fails with "This Venue is already booked on this date."	Pending
TC-03	Venue reserved	Set an Event to Confirmed.	Venue Availability Status becomes Reserved.	Pending
TC-04	Venue available	Set the Event to Canceled.	Venue Availability Status becomes Available.	Pending
TC-05	Cancellation approval	Set Event Status to Pending Cancellation and submit for approval; approve it.	Record locks on submit; on approval the status updates and an email alert is sent.	Pending
TC-06	Cancellation rejection	Repeat TC-05 and reject the request.	Record unlocks, status changes to Rejected, rejection email is sent.	Pending
TC-07	Client reminder Flow	Create an Event dated a few days ahead.	Scheduled path sends the reminder 3 days before the Event Date.	Pending
TC-08	Batch job	Run BatchCompleteEvents with a past, non-completed Event.	The past Event is set to Completed.	Pending
TC-09	Access control	Log in as Event Coordinator and Vendor Manager.	Each user sees only what the profile, role and OWD allow.	Pending

8. Advantages and Disadvantages

Advantages

- All event, client, venue, vendor and feedback data sits in one connected CRM.
- A venue cannot be double booked on the same date; the error is shown before the save.
- Venue availability is updated by code, with no manual step.
- Clients are reminded three days before their event by the Flow.
- Cancellations follow a manager approval with record lock and email alerts.
- Profiles, roles, a permission set and OWD keep access under control.
- A batch job marks past events as Completed.

Disadvantages

- The double-booking check compares only the event date, not start and end times.
- Venue status follows the last saved event, so cancelling one event can show a venue as Available even if it has another confirmed event on a different date.

- The approval has a single step with one assigned approver.
- There is no sharing rule yet; Event is Private, so Vendor Managers see events only through the role hierarchy.
- No client user or client portal has been created.
- No Apex test classes are written yet, which a production deployment would need.
- Reminder emails depend on a verified email sending domain.

9. Conclusion

EventForce shows how a standard Salesforce org can be shaped into a working event management system. Given a clear data model, the system blocks double bookings, keeps venue availability current, reminds clients before their event, routes cancellations for approval and limits access by role. Through this project the team learned object design and relationships, Flow with scheduled paths, approval processes, Batch and Schedulable Apex, and the Salesforce security model. The outcome is less manual follow-up, cleaner data and a clear view of upcoming events for the whole team.

10. Future Scope

- **Smarter booking:** check time slots and overlapping dates, not only the event date.
- **Approvals:** add more approval steps and escalation when a request is not answered.
- **Sharing:** add sharing rules and a client portal so clients can see their own events.
- **Quality:** write Apex test classes with enough code coverage for a production release.
- **Reminders:** add SMS or WhatsApp reminders along with email, using a verified sender domain.
- **Insight:** add reports and dashboards for vendor performance, feedback ratings and budgets.

11. Appendix

Ref	Item	Description
A	Custom objects	Event__c, Client__c, Vendor__c, Venue__c, Feedback__c, Event Vendor (junction)
